

# FORECAST OF THE STATE POPULATION BY AGE AND SEX: 1990 TO 2020

NOVEMBER 1999 FORECAST

## Technical Notes

---

The 1990 census population by age and sex, actual vital events through December 31, 1998, and the April 1, 1999 estimate of the state's population are utilized as the starting point for the forecast of Washington State population through 2020. A 1990 decennial Washington State life table was used to survive the population. Projections of life expectancy are based on Table B-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census. Age-specific fertility projections are based on Table-1 in *Current Population Reports*, Series P-25, No. 1104, November 1994, U. S. Bureau of the Census. The distribution of net migrants by age and sex was primarily derived from intercensal (1980-1990) estimates of the age-sex structure of migration for Washington State.

## General Discussion of State Growth

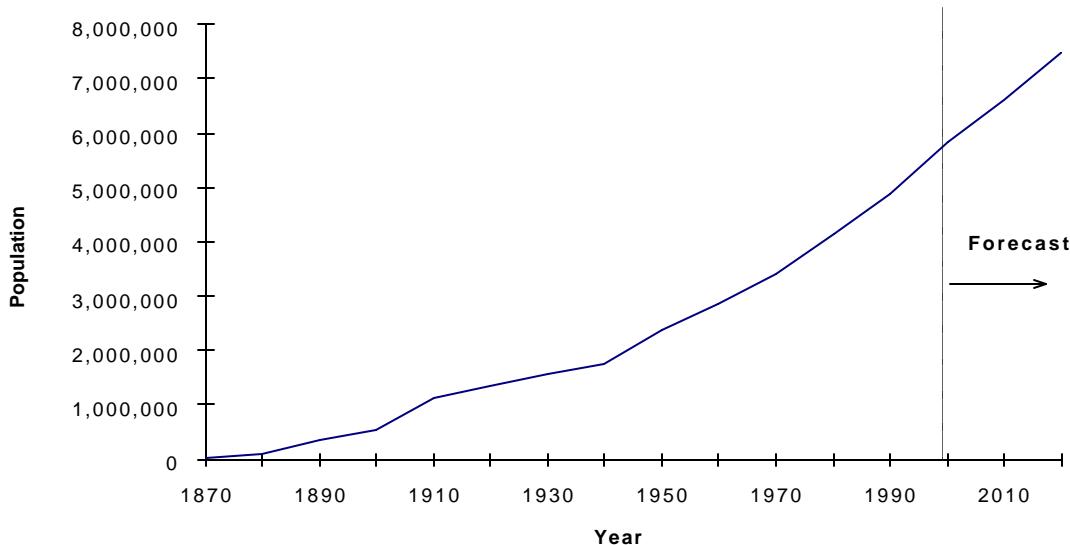

---

The 1999 state population forecast is based on actual births and deaths through December 1998, the official 1999 estimate of the state's population, and a provisional estimate of the year 2000 population.

The 1999 state forecast shows a lower level of population growth than the forecast prepared in 1998. The primary reason for the adjustment is the lower than expected migration gains through fall 1999. Movement to Washington has been moderated by California's strong economic recovery and the strength of the national economy as a whole. Washington State's employment opportunities have met with strong competition from other states. Aerospace employment reductions and soft Asian markets are contributing factors. Migration gains, which remained between 50,000 and 60,000 for several years—dropped to 41,200 in 1998, 35,200 in 1999, and are now expected to slow to 24,100 by 2001.

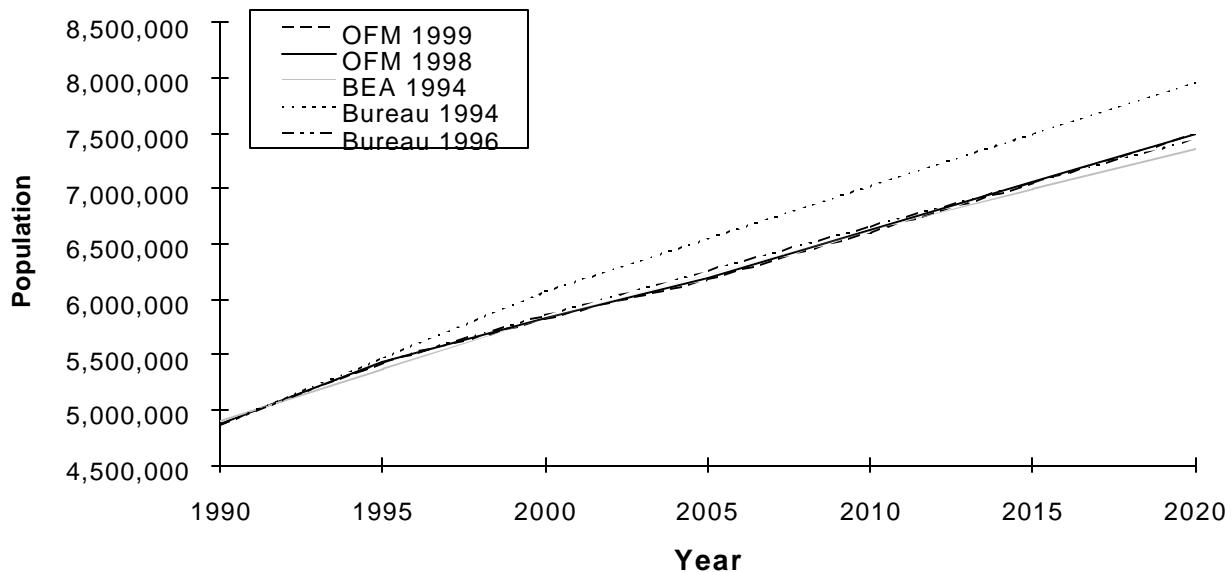

Washington's population has increased by about 20 percent per decade since the 1960s and is still expected to grow by nearly 20 percent (19.6 percent) over the 1990s. The 1999 population estimate of 5,757,400 represents an increase of 890,700 over the last nine years. The state population is expected to reach 6 million soon after the turn of the century and almost 7.5 million by 2020.

**Washington State shows strong historical population growth.  
Forecast growth is in line with historical experience.**

The graph below shows OFM's 1999 projection compared to the 1998 state projection and other projections for Washington prepared by the federal Bureau of the Census (*Current Population Reports*, P-25, No.1111, 1994; *Current Population Reports*, PLL-47, 1996) and the Bureau of Economic Analysis (1994).

**Projections for Washington State show only moderate differences.**

## Population and Components of Change

---

The components of population change are births, deaths, and migration. The excess of births over deaths is called natural increase. Persons moving to Washington (inmigration) minus persons leaving the state (outmigration) is net migration. Table 1 shows the components of population change for 1991 through 2020. Births from 1990 through 1998 are actual vital events.

OFM FORECASTING DIVISION

NOVEMBER 1999

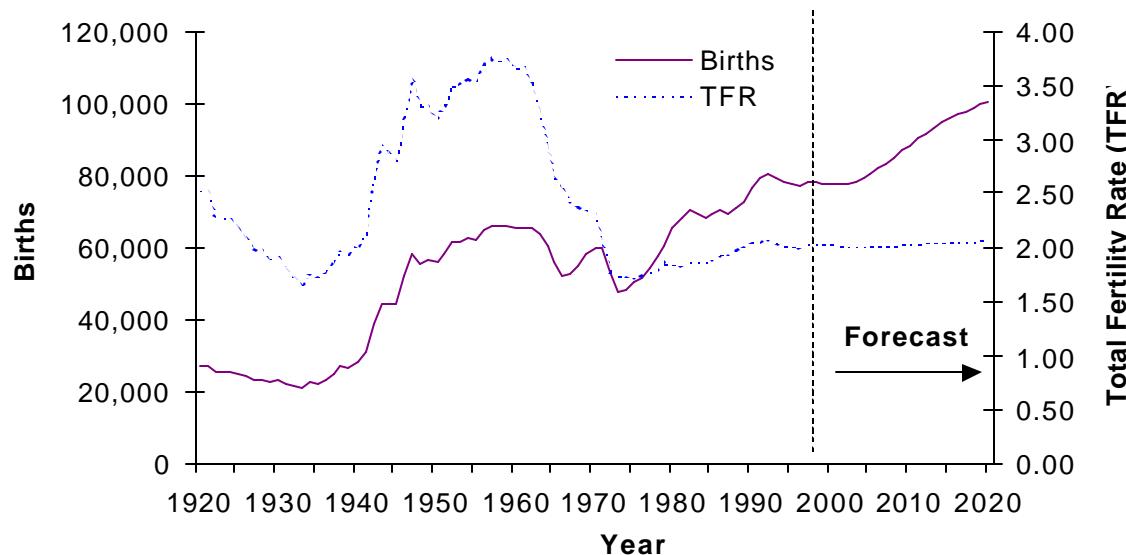

### Fertility

Historic fertility levels in Washington, as in the nation, have followed a roller coaster pattern. However, since the mid-1980s the state's total fertility rate (TFR)—the average number of births per woman—has remained relatively constant. The average number of births per woman is actually a hypothetical value. It is the average lifetime births expected by a group of women if they followed the age-specific birth rates for a given year.

Actual birth levels in Washington increased and then stabilized as the Baby Boom generation aged to have children. Births are expected to rise again as this new bulge of youngsters reach adulthood and begin their families. Thus, even though total fertility is expected to remain relatively constant, changes in the number of women of child bearing age will continue to cause some fluctuation in fertility levels. The following outline shows some of the historic fertility peaks and valleys.

Year	Social and Economic Climate	Number of Annual Births	Average Number of Births Per Woman
1933	Bottom of the Depression	20,800	1.6
1957	Peak of Baby Boom, economic prosperity	65,900	3.7
1975	Increases in working women, increased age at first marriage, and delayed childbearing.	49,500	1.7
1980s	Children of the Baby Boomers reach adulthood.	68,000 to 71,000	1.8 to 2.0
Early 1990s	Slight rise in fertility rates, delayed first/or second births recognized.	79,000 to 80,000	2.0 to 2.02
Late 1990s	Modest fluctuations in fertility levels, down and then up. Fewer women in peak childbearing age.	78,700	2.04
-----Forecast-----			
2000-2020	Forecast follows U.S. Census Bureau national forecast assumptions. No major changes in average births per woman.	Births gradually increase from 79,700 to 102,000 by 2020	2.09

**Number of births per woman is expected to be low but a large number of women will have children between 1990 and 2020.**

If women were currently having children at birth rates comparable to the Baby Boom years—births would total 140,000 births per year. By the year 2020 there would be nearly 200,000 births per year. There is no indication that high fertility rates will return—not given the high level of women's participation in the labor force, delayed marriage, and delayed childbearing after marriage.

## Mortality

The first half of the 1900s saw dramatic improvements in nutrition and health care that reduced infant deaths and markedly increased life expectancy. After that time, gains in infant health and life expectancy continued, but at a slower pace. Infant death rates are now quite low. Bureau of the Census research indicates that from the late 1990s forward no medical breakthroughs are anticipated that will greatly increase life expectancy. Gains in life expectancy are expected to come from improved maternal health care, lifestyle changes, and treatment of hypertension.

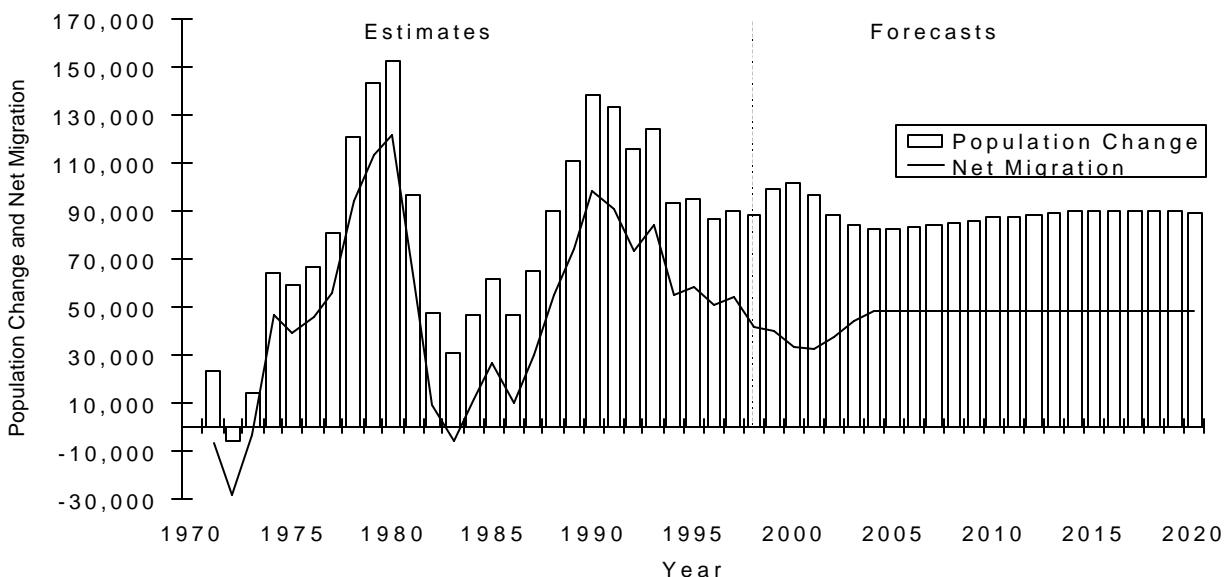

The following outline shows improvements in life expectancy over time and future expectations.

<b>Year</b>	<b>Infant Mortality/Comments</b>	<b>Number of Annual Deaths</b>	<b>Life Expectancy in Years</b>	
			<b>Male</b>	<b>Female</b>
1920s	Large proportion of deaths to infants in first year of life—approximately 56 per 1,000.	15,000	58	60
1960	Major advances in nutrition and medicine occurred between 1920 and 1960. Infant mortality reduced to 23 per 1,000.	26,500	68	75
1980	Infant mortality reduced to 12 per 1,000.	32,000	72	79
Late 1990s	Large improvements in life expectancy unlikely. Infant mortality 8 per 1,000.	43,000	74	80
-----Forecast-----				
2020	Forecast follows U.S. Census Bureau recent national forecast assumptions. Slow but continued improvements in life expectancy.	60,500	77	83

## Migration

Migration, the most variable component of population change, is largely an economic phenomenon relating push and pull factors. Migration usually varies as the result of changing economic conditions in Washington relative to other states. Some migration, such as military movements or the migration of retired persons, is not economic.

**Net migration is a major contributor to population change in Washington State.**

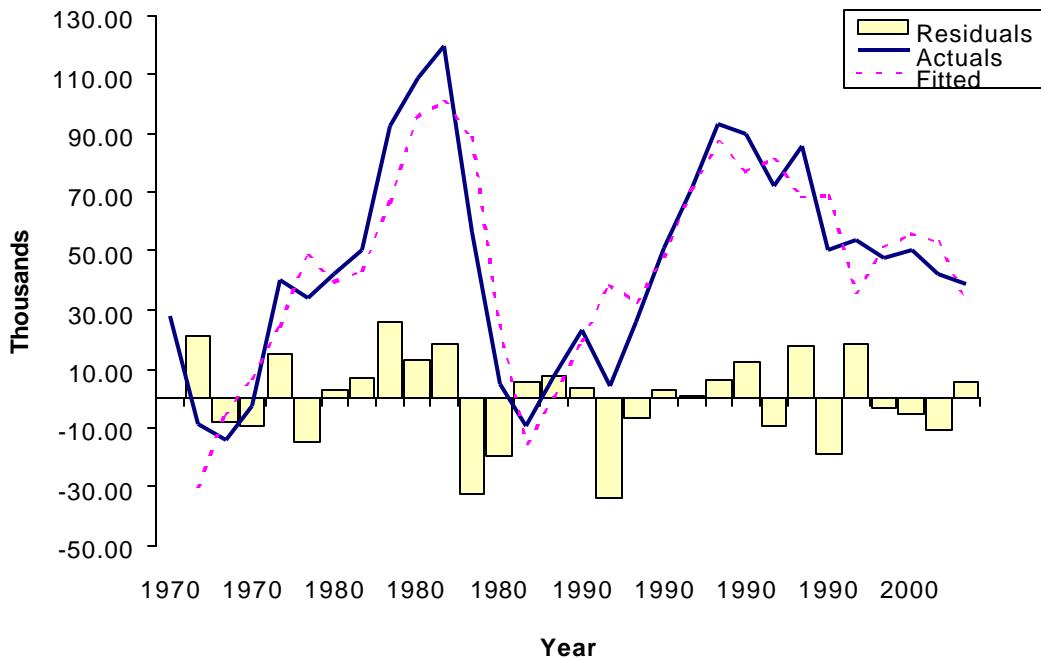

OFM FORECASTING DIVISION

NOVEMBER 1999

Annual migration is developed separately for three time periods: (1) historical and current estimates, (2) near term projections, and (3) long term projections.

Year (s)	Method	Distinguishing Characteristics Of Method	Data and Assumptions (if applicable)
1990-1999	Estimates	Developed from estimates of annual population change based on <b>actual change</b> in several sets of symptomatic data	School enrollment, voters and automobile registrations, driver licenses, births, deaths and medicare enrollment.
2000	Provisional Estimate	Developed from provisional change based on one variable	School enrollment
2001, 2002	Near Term Projection	Regression model relating net migration to the state's near term relative economic performance. (See page 8)	Employment forecasts from the Economic and Revenue Forecast Council (Sept. 1999) and data from Data Resources Inc. (DRI)  Washington's traded sector job growth becomes weaker than the US and California due to a slowdown in high tech manufacturing and a decline in aerospace employment.
2003, 2004	Transition Period		Two-year transition period blending the near term and long term projection
2005-2020	Long Term Projection	Regression model relating net migration to the state's long term relative economic performance. <i>Results expressed as average annual migration.</i>	Long-term employment forecasts from Bureau of Economic Analysis and DRI. Long term, Washington's traded sector and producer services employment is expected to outperform the US and California.

### Comparison of actual and predicted net migration using OFM's model, 1970-1999.

OFM FORECASTING DIVISION

NOVEMBER 1999

*Projected migration is modeled with econometric techniques that integrate economic performance expectations with population outcomes by quantitatively relating changes in traded sector employment to net migration. The econometric model developed to project net migration for Washington State includes three major components:*

- The percent change in Washington's traded sector employment relative to the percent change in traded sector employment in the U.S.
- The percentage change in Washington's traded sector employment relative to the percentage change in traded sector employment in California, lagged one year.
- The U.S. unemployment rate.
- Net migration in the previous year.

"Traded" industries include manufacturing, federal civilian government, and producer services (services purchased by businesses). Changes in state traded sector employment are closely associated with varying levels of net migration over time.

Assumptions in long term employment expectations that determine migration are specified in more detail below.

- **Washington is expected to out-perform the U.S. in the growth of the traded sector employment.** This makes Washington an attractive place, economically speaking, for potential migrants.
- **Growth in manufacturing employment in Washington is expected to perform better than in the U.S. and California.** The forecasts for California and the U.S. show a long-run decline in manufacturing employment. In Washington, manufacturing employment is predicted to maintain a small but positive rate of growth. Historically, manufacturing employment in Washington, excluding aerospace and lumber and wood products, has always grown faster than in the U.S. This trend is expected to continue.
- **Employment growth in producer services in Washington is expected to perform better than the U.S. producer services employment in the early years of the forecast.** Historically, Washington has experienced significantly faster employment growth in producer services than the U.S. This is expected to continue with the difference declining. In the last ten years of the forecast period, the producer services sector in Washington is projected to grow at about the same rate as the U.S.
- **Employment growth in federal civilian government employment in Washington will decline modestly in the near term, but not as much as in California or the U.S.** Washington has come out of the federal government and military reductions better than most states. Defense spending and some military cuts have occurred, but there have been no major base closures, and the Everett Home Port has been completed. After the year 2000, Washington is expected to follow the national trend in terms of reductions in federal civilian employment.

## Population in Selected Age Groups

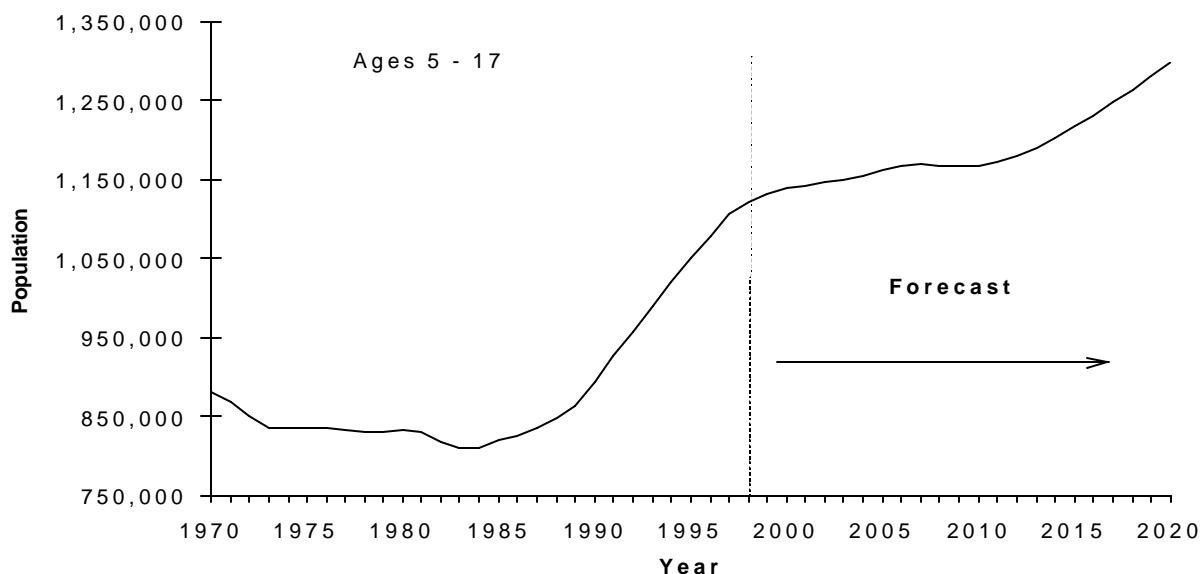

---

Changes in the number of persons in selected age groups will place new demands on, and make new contributions to society, the economy, and government. Of special interest are: children ages 5 through 17; young adults ages 18 through 24; various groups of working-age adults, ages 18 through 64; and the elder population, ages 65 and over.

### School-Age Children

There are an estimated 1,130,770 youngsters aged 5 to 17 in 1999. This age cohort is expected to increase by 11,325 through the end of the 1999-2001 budget period and reach 1,142,095 by the year 2001. Growth is then expected to slow down and not show major increases until after 2015.

**School-age population will grow in the early part of the forecast period,  
Level off in the middle, then continue its growth later.**

OFM FORECASTING DIVISION

NOVEMBER 1999

### Young Adults

After a long-term decline, the number of young adults ages 18 to 24 began to increase in 1997. There are an estimated 521,900 persons age 18 to 24 in 1999. This age group is expected to exceed its prior peak of nearly 564,000 by the year 2002 and will continue increasing through 2013. Post-secondary educational institutions should experience enrollment pressure as the size of the young adult population increases.

**Young adults reached a low in 1996 and started to grow steadily from 1997.**

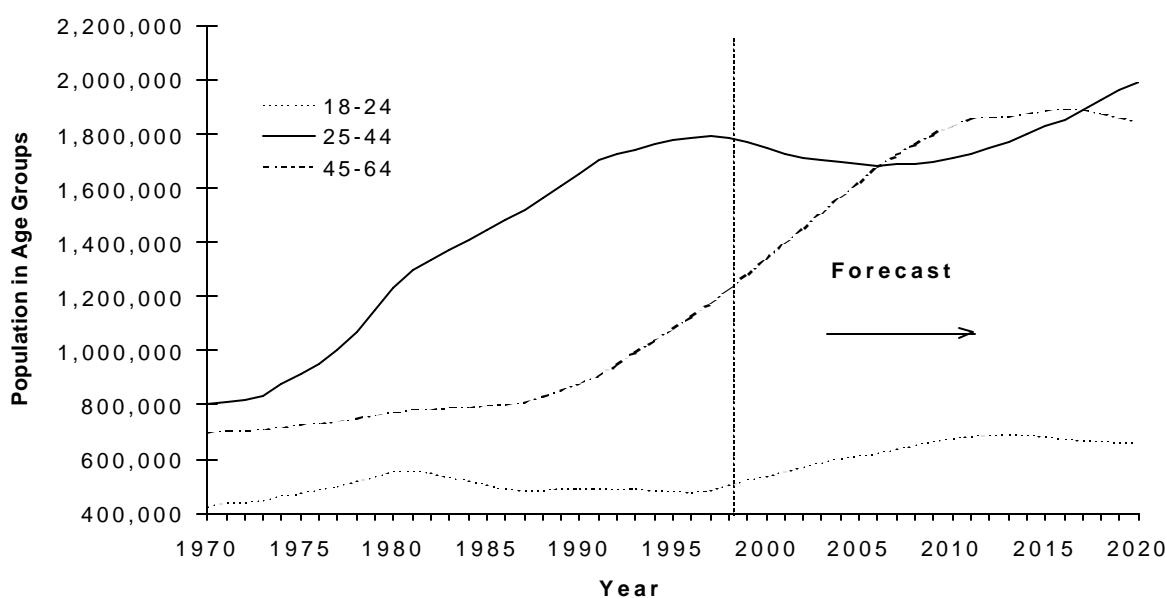

OFM FORECASTING DIVISION

NOVEMBER 1999

### Working Age Adults

Persons 25 to 44, totaling 1,766,300 in 1999, should reach 1,975,000, nearly 2 million by 2020. Older workers, persons between 45 and 64, will grow by over half a million in the next 20 years as the Baby Boom generation ages – from 1,281,600 in 1999 to a peak of 1,877,400 in 2017.

**Working-age adults in their prime earning years will increase in number.**

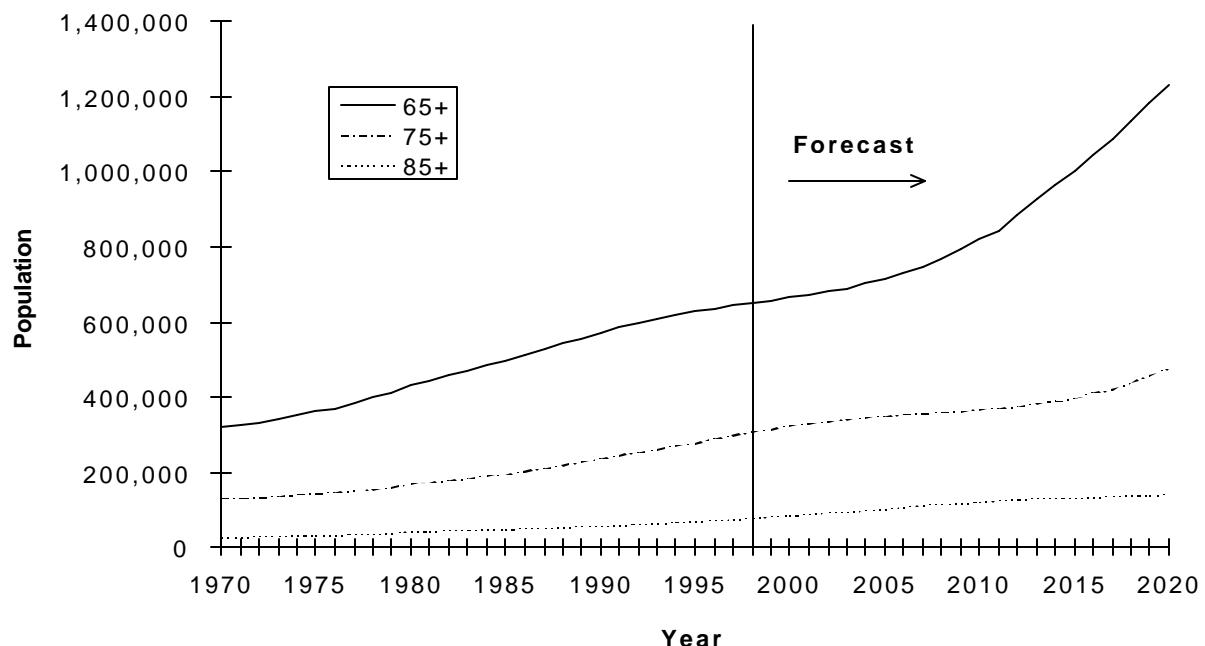

OFM FORECASTING DIVISION

NOVEMBER 1999

## Elderly Population

Washington's population age 65 and over, estimated at 655,200 in 1999, is expected to reach 808,300 by 2010 and 1.2 million by the year 2020. The population age 75 and over shows the most rapid growth after 2015 when the Baby Boom generation has its impact. Persons age 85 and over will approach 85,600 by 2000 and number nearly 140,100 by 2020.

**The elderly population will grow rapidly after 2005.**
